

Winston-Louisville CTC students participated in a gardening workshop for Earth Week. Special thanks to Winston County Self-Help Cooperative and MSU Winston County Extension for the presentation. Here are some reflections.

On this trip, I've learned that plants need a lot more than just water and food to help them grow. Most plants need water, food, and other essentials to keep them protected from bugs. I also learned that it has to be a certain type of season to plant different types of plants. Gardeners have to make sure that the bug repellents they use don't kill the good bugs that help the plant. Whenever gardeners water their plants or it rains, many have trouble getting rid of ants. It is recommended that they should purchase ant insecticide to help get rid of most of the ants and their territories.

Going on this trip was fun, I got to learn some new tips about how to grow certain plants and keep them alive. I learned that you have to feed your plants more than just water. You have to get your plant some Plant food and you have to protect your plant from bugs. However, you have to make sure you don't kill the good bugs that help your plant. Also, you're probably gonna have to get an ant Insecticide to help cut down on the ants on your land.

This was a fun trip. I learned that different plants have different needs. While some plants can stay in the sun all day and thrive, others do better in the shade. I also learned that plants need certain nutrients like nitrogen and phosphorous to grow healthy.
